

FileSplitterJoiner 0.1

Copyright 2009. shiz

This software is released under the LGPL.

This is the source release.

FileSplitterJoiner comes as two parts:

1. A program called filesplitter which splits the file into multiple parts. Run the program, type in the full file name and choose the method of splitting. Then press *Split*. If the original file is called boat.mkv, then the parts are called boat.mkv.1, boat.mkv.2, etc.
2. A program called filejoiner which joins the multiple parts into a single file. Run the program, type in the full file name of *the last part*. Then press *Join*. The filename will be the name of the original file.
